6 **Abstract** This paper deals with the stability analysis of positive delay-descrip-  
7 tor systems with arbitrarily high index. First we discuss the solvability problem  
8 (i.e., about the existence and uniqueness of a solution), which is followed by  
9 the study on characterizations of the (internal) positivity. Finally, we discuss  
10 the stability analysis. Numerically verifiable conditions in terms of matrix in-  
11 equality for the system's coefficients are proposed, and are examined in several  
12 examples.

13 **Keywords** Positivity · Delay · Descriptor systems · Strangeness-index .

14 **Nomenclature**

$\mathbb{N} (\mathbb{N}_0)$	the set of natural numbers (including 0)
$\mathbb{R} (\mathbb{C})$	the set of real (complex) numbers
$\mathbb{C}_-$	the set $\{\lambda \in \mathbb{C} \mid \operatorname{Re}\lambda < 0\}$
$I (I_n)$	the identity matrix (of size $n \times n$ )
$x^{(j)}$	the $j$ -th derivative of a function $x$
$C^p([-\tau, 0], \mathbb{R}^n)$	the space of $p$ -times continuously differentiable functions from $[-\tau, 0]$ to $\mathbb{R}^n$ (for $0 \leq p \leq \infty$ )
$\ \cdot\ _\infty$	the norm of the Banach space $C^0([-\tau, 0], \mathbb{R}^n)$ .
$\operatorname{im}_+ W$	the space $\{Ww_1 \text{ for all } w_1 \in \mathbb{R}_+^n\}$ .

**16 1 Introduction**

Our focus in the present paper is on the positivity and stability analysis of linear, constant coefficients *delay-descriptor systems* of the form

$$\begin{aligned} E\dot{x}(t) &= Ax(t) + A_dx(t - \tau) + Bu(t), \quad \text{for all } t \in [t_0, t_f], \\ y(t) &= Cx(t), \end{aligned} \quad \{ \text{sec1} \} \quad (1) \quad \{\text{delay-descriptor}\}$$

<sup>17</sup> where  $E, A \in \mathbb{R}^{n,n}, B \in \mathbb{R}^{n,p}, C \in \mathbb{R}^{q,n}, x : [t_0 - \tau, t_f] \rightarrow \mathbb{R}^n, f : [t_0, t_f] \rightarrow \mathbb{R}^n,$   
<sup>18</sup> and  $\tau > 0$  is a constant delay. Together with (1), we are also concern with  
<sup>19</sup> the associated *zero-input/free system*

$$E\dot{x}(t) = Ax(t) + A_dx(t - \tau), \quad \text{for all } t \in [t_0, t_f]. \quad \{ \text{free system} \} \quad (2)$$

<sup>20</sup> Systems of the form (1) can be considered as a general combination of two  
<sup>21</sup> important classes of dynamical systems, namely *differential-algebraic equations*  
<sup>22</sup> (*descriptor systems*) (DAEs)

$$E\dot{x}(t) = Ax(t) + Bu(t), \quad \{ \text{eq1.2} \} \quad (3)$$

<sup>23</sup> where the matrix  $E$  is allowed to be singular ( $\det E = 0$ ), and *delay-differential*  
<sup>24</sup> *equations* (DDEs)

$$\dot{x}(t) = Ax(t) + A_dx(t - \tau) + Bu(t). \quad \{ \text{eq1.3} \} \quad (4)$$

<sup>25</sup> delay-descriptor systems of the form (1) have been arisen in various applica-  
<sup>26</sup> tions, see Ascher and Petzold [1995], Campbell [1980], Hale and Lunel [1993],  
<sup>27</sup> Shampine and Gahinet [2006], Zhu and Petzold [1997] and the references there  
<sup>28</sup> in. From the theoretical viewpoint, the study for such systems is much more  
<sup>29</sup> complicated than that for standard DDEs or DAEs. The dynamics of DDAEs  
<sup>30</sup> has been strongly enriched, and many interesting properties, which occur nei-  
<sup>31</sup> ther for DAEs nor for DDEs, have been observed for DDAEs Campbell [1995],  
<sup>32</sup> Du et al. [2013], Ha and Mehrmann [2012, 2016]. Due to these reasons, re-  
<sup>33</sup> cently more and more attention has been devoted to DDAEs, Campbell and  
<sup>34</sup> Linh [2009], Fridman [2002], Ha and Mehrmann [2012, 2016], Michiels [2011],  
<sup>35</sup> Shampine and Gahinet [2006], Tian et al. [2014], Linh and Thuan [2015].

<sup>36</sup>  
<sup>37</sup> [...]

<sup>38</sup> The short outline of this work is as follows. Firstly, in Section 2, we briefly  
<sup>39</sup> recall the solvability analysis to system (1), which is followed by an imporant  
<sup>40</sup> result about solution comparison for the free system (2) (Theorem 3). Based on  
<sup>41</sup> the explicit solution representation in Section 2, we characterize the posivity  
<sup>42</sup> of system (1) in Section 3. We establish there algebraic, numerically verifiable  
<sup>43</sup> conditions in terms of the system matrix coefficients. To follow, in Section 4  
<sup>44</sup> we discuss further about the free system (2) under biconditional requirements:  
<sup>45</sup> stability and positivity. Finally, we conclude this research with some discussion  
<sup>46</sup> and open questions.

---

## 48 2 Preliminaries

49 In this section we discuss the solvability analysis, including the solution repre-  
 50 sentation and the comparison principal for the corresponding IVP to system  
 51 (1), which consists of (1) together with an initial condition

$$x|_{[t_0-\tau, t_0]} = \varphi : [t_0 - \tau, t_0] \rightarrow \mathbb{R}^n. \quad (5) \quad \{\text{initial condition}\}$$

52 Here,  $\varphi$  is a prescribed initial trajectory (preshape function), which is necessary  
 53 to achieve uniqueness of solutions. Without loss of generality, we assume that  
 54  $t_0 = 0$  and  $t_f = n_f\tau$ , where  $n_f \in \mathbb{N}$ .

### 55 2.1 Existence, uniqueness and explicit solution formula

56 It is well-known (e.g. Du et al. [2013]) that we may consider different solution  
 57 concepts for system (1). The reason is, that  $E(0)\dot{x}(0^+)$  which arises from the  
 58 right hand side in (1) at 0 may not be equal to  $E(0)\dot{\varphi}(0^-)$ . Moreover, it has  
 59 been observed in Baker et al. [2002], Campbell [1980], Guglielmi and Hairer  
 60 [2008] that a discontinuity of  $\dot{x}$  at  $t = 0$  may propagate with time, and typically  
 61  $\dot{x}$  is discontinuous at every point  $j\tau$ ,  $j \in \mathbb{N}_0$  or it may not even exist. To deal  
 62 with this property of DDAEs, we use the following solution concept.

63 **Definition 1** Let us consider a fixed input function  $u(t)$ .

- 64 i) A function  $x : [-\tau, \infty) \rightarrow \mathbb{R}^n$  is called a *piecewise differentiable solution* of  
 65 (1), if  $Ex$  is piecewise continuously differentiable,  $x$  is continuous and satisfies  
 66 (1) at every  $t \in [t_0, t_f) \setminus \bigcup_{j \in \mathbb{N}_0} \{j\tau\}$ .  
 67 ii) A function  $x : [-\tau, \infty) \rightarrow \mathbb{R}^n$  is called a *classical solution* of (1) if it is at  
 68 least continuous and satisfies (1) at every  $t \in [t_0, t_f]$ .

69 Throughout this paper whenever we speak of a solution, we mean a piece-  
 70 wise differentiable solution. Notice that, like DAEs, DDAEs are not solvable  
 71 for arbitrary initial conditions, but they have to obey certain consistency con-  
 72 ditions.

73 **Definition 2** An initial function  $\varphi$  is called *consistent* with (1) if the associ-  
 74 ated initial value problem (IVP) (1), (5) has at least one solution. System (1)  
 75 is called *solvable* (resp. *regular*) if for every consistent initial function  $\varphi$ , the  
 76 IVP (1), (5) has a solution (resp. has a unique solution).

Introducing sequences of matrix-valued and vector-valued functions  $f_j$ ,  $u_j$ ,  
 $x_j$  for each  $j \in \mathbb{N}$ , on the time interval  $[0, \tau]$  via

$$\begin{aligned} f_j(t) &= f(t + (j-1)\tau), \quad u_j(t) = u(t + (j-1)\tau), \\ x_j(t) &= x(t + (j-1)\tau), \quad x_0(t) := \varphi(t - \tau), \end{aligned}$$

77 we can rewrite the IVP (1)-(5) as a sequence of non-delayed descriptor systems

$$E\dot{x}_j(t) = Ax_j(t) + A_dx_{j-1}(t) + Bu_j(t), \quad (6) \quad \{\text{j-th DAE}\}$$

78 for all  $t \in (0, \tau)$  and for all  $j = 1, 2, \dots, n_f$ . We notice, that for each  $j$ , the  
 79 initial condition  $x_j(0)$  is given due to the continuity of the solution  $x(t)$  at the  
 80 point  $(j-1)\tau$ , i.e.,

$$x_j(0) = x_{j-1}(\tau) . \quad (7) \quad \{\text{continuity condition}\}$$

81 In particular,  $x_1(0) = \phi(0)$  and the function  $x_0$  is given.

82  
 83 It is well-known (see e.g. Bellman and Cooke [1963], Hale and Lunel [1993])  
 84 that in general, time-delayed systems has been classified into three different  
 85 types (retarded, neutral, advanced). For example, the time-delayed equation

$$a_0\dot{x}(t) + a_1\dot{x}(t - \tau) + b_0x(t) + b_1x(t - \tau) = f(t)$$

86 is retarded if  $a_0 \neq 0$  and  $a_1 = 0$ ; is neutral if  $a_0 \neq 0$ ,  $a_1 \neq 0$ ; is advanced  
 87 if  $a_0 = 0$ ,  $a_1 \neq 0$ ,  $b_0 \neq 0$ . Obviously, this classification is based on the  
 88 smoothness comparison between  $x(t)$  and  $x(t - \tau)$ . In literature, not only  
 89 the theoretical but also numerical solution has been studied mainly for non-  
 90 advanced systems (i.e., retarded or neutral), due to their appearance in various  
 91 applications. For this reason, in Ha [2015], Ha and Mehrmann [2016], Unger  
 92 [2018] the authors proposed a concept of *non-advancedness* for (1) (see Definition  
 93 below). We also notice, that even though not clearly proposed, due to  
 94 the author's knowledge, so far results for delay-descriptor are only obtained  
 95 for certain classes of non-advanced systems, e.g. Ascher and Petzold [1995],  
 96 Shampine and Gahinet [2006], Zhu and Petzold [1997, 1998], Michiels [2011].

97 **Definition 3** A regular delay-descriptor system (1) is called *non-advanced* if  
 98 for any consistent and continuous initial function  $\varphi$ , there exists a piecewise  
 99 differentiable solution  $x(t)$  to the IVP (1), (5).

100 **Definition 4** Consider the DDAE (1). The matrix triple  $(E, A, B)$  is called  
 101 *regular* if the (two variable) *characteristic polynomial*  $\det(\lambda E - A - \omega B)$  is  
 102 not identically zero. If, in addition,  $B = 0$  we say that the matrix pair  $(E, A)$   
 103 (or the pencil  $\lambda E - A$ ) is regular. The sets  $\sigma(E, A, B) := \{\lambda \in \mathbb{C} \mid \det(\lambda E -$   
 104  $A - e^{-\lambda\tau}B) = 0\}$  and  $\rho(E, A, B) = \mathbb{C} \setminus \sigma(E, A, B)$  are called the *spectrum* and  
 105 the *resolvent set* of (1), respectively.

106 Provided that the pair  $(E, A)$  is regular, we can transform them to the  
 107 Kronecker-Weierstraß canonical form (see e.g. Dai [1989], Kunkel and Mehrmann  
 108 [2006]). That is, there exist regular matrices  $W, T \in \mathbb{R}^{n,n}$  such that

$$(E, A) = \left( W \begin{bmatrix} I & 0 \\ 0 & N \end{bmatrix} T, W \begin{bmatrix} J & 0 \\ 0 & I \end{bmatrix} T \right) , \quad (8) \quad \{\text{KW form}\}$$

109 where  $N$  is a nilpotent matrix of nilpotency index  $\nu$ . We also say that the pair  
 110  $(E, A)$  has a *differentiation index*  $\nu$ , i.e.,  $\text{ind}(E, A) = \nu$ .

111 *Remark 1* Two concepts non-advancedness and differentiation index are inde-  
 112 pendent. In details, a non-advanced system can have arbitrarily high index, as  
 113 can be seen in the following example.

{def2}

{regularity}

<sup>114</sup> Example 1 Consider the following systems with the parameters  $\varepsilon_1, \varepsilon_2$ . {example 1}

$$\underbrace{\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}}_E \dot{x}(t) = \underbrace{\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}}_A x(t) + \underbrace{\begin{bmatrix} 0 & \varepsilon_1 \\ 0 & \varepsilon_2 \end{bmatrix}}_{A_d} x(t - \tau). \quad (9) \quad \{\text{eq11}\}$$

<sup>115</sup> It is well-known that in this example  $\text{ind}(E, A) = 2$ . Furthermore, depending  
<sup>116</sup> on the value of  $\varepsilon_2$ , the system will be advanced (if  $\varepsilon_2 \neq 0$ ) and be non-advanced  
<sup>117</sup> (if  $\varepsilon_2 = 0$ ). Analogously, one can construct a non-advanced system which has  
<sup>118</sup> an arbitrarily high index.

<sup>119</sup> Let  $E$  have index  $\tilde{\nu}$ , i.e.,  $\text{ind}(E, I_n) = \tilde{\nu}$ , the Drazin inverse  $E^D$  of  $E$  is  
<sup>120</sup> uniquely defined by the properties

$$E^D E = E E^D, \quad E^D E E^D = E^D, \quad E^D E^{\tilde{\nu}+1} = E^{\tilde{\nu}}. \quad (10)$$

<sup>121</sup> Lemma 1 Kunkel and Mehrmann [2006] Let  $(E, A)$  be a regular matrix pair. {lem1}  
<sup>122</sup> Then for any  $\lambda \in \rho(E, A)$ , two following matrices commute.

$$\hat{E} := (\lambda E - A)^{-1} E, \quad \hat{A} := (\lambda E - A)^{-1} A. \quad (11) \quad \{\text{eq20}\}$$

<sup>123</sup> Furthermore, the following commutative identities hold true.

$$\hat{E} \hat{A}^D = \hat{A}^D \hat{E}, \quad \hat{E}^D \hat{A} = \hat{A} \hat{E}^D, \quad \hat{E}^D \hat{A}^D = \hat{A}^D \hat{E}^D.$$

<sup>124</sup> We notice that the matrix products  $\hat{E}^D \hat{E}$ ,  $\hat{E}^D \hat{A}$ ,  $\hat{E} \hat{A}^D$ ,  $\hat{E}^D \hat{B}$ ,  $\hat{A}^D \hat{B}$  do  
<sup>125</sup> not depend on the choice of  $\lambda$  (see e.g. Dai [1989]). Furthermore, they can  
<sup>126</sup> be numerically computed by transforming the pair  $(E, A)$  to their Weierstrass  
<sup>127</sup> canonical form (8) (see e.g. Varga [2019], Virnik [2008]).

<sup>128</sup> For any  $\lambda \in \rho(E, A)$ , we denote

$$\hat{A}_d := (\lambda E - A)^{-1} A_d, \quad \hat{B} := (\lambda E - A)^{-1} B. \quad (12) \quad \{\text{eq21}\}$$

<sup>129</sup> Making use of the Drazin inverse, in the following theorem we present the  
<sup>130</sup> explicit solution representation of system (1).

**Theorem 1** Consider the delay-descriptor system (1). Assume that  $(E, A)$  is a regular matrix pair with a differentiation index  $\text{ind}(E, A) = \nu$ . Let  $\hat{E}$ ,  $\hat{A}$ ,  $\hat{A}_d$ ,  $\hat{B}$  be defined as in (11), (12). Furthermore, assume that  $u$  is sufficiently smooth. Then, every solution  $x_j$  of the DAE (6) has the form

$$\begin{aligned} x_j(t) &= e^{\hat{E}^D \hat{A} t} \hat{E}^D \hat{E} v_j + \int_0^t e^{\hat{E}^D \hat{A}(t-s)} \hat{E}^D \left( \hat{A}_d x_{j-1}(s) + \hat{B} u_j(s) \right) ds \\ &+ (\hat{E}^D \hat{E} - I) \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \left( \hat{A}_d x_{j-1}^{(i)}(t) + \hat{B} u_j^{(i)}(t) \right), \end{aligned} \quad (13) \quad \{\text{j-th solution}\}$$

<sup>131</sup> for some vector  $v_j \in \mathbb{R}^n$ .

{sol. rep. DAE}

<sup>132</sup> *Proof.* The proof is straightly followed from the explicit solution of DAEs, see  
<sup>133</sup> [Kunkel and Mehrmann, 2006, Chap. 2].  $\square$

<sup>134</sup> Making use of (7), we directly obtain the following corollary.

<sup>135</sup> **Corollary 1** *The solution  $x(t)$  of system (1) is continuous at the point  $(j-1)\tau$*   
<sup>136</sup> *if and only if the following condition holds.*

$$(\hat{E}^D \hat{E} - I) x_{j-1}(\tau) = (\hat{E}^D \hat{E} - I) \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \left( \hat{A}_d x_{j-1}^{(i)}(0) + \hat{B} u_j^{(i)}(0) \right).$$

<sup>137</sup> In particular, for the preshape function  $\varphi(t)$ , we must require

$$(\hat{E}^D \hat{E} - I) \left( \varphi(0) + \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \left( \hat{A}_d \varphi^{(i)}(-\tau) + \hat{B} u^{(i)}(0) \right) \right) = 0.$$

<sup>138</sup> Following from (13), we directly obtain a simpler form in case of non-  
<sup>139</sup> advanced system as follows.

**Corollary 2** *Consider system (1) and assume that it is regular and non-advanced. Then, we have*

$$\begin{aligned} x_j(t) &= e^{\hat{E}^D \hat{A} t} \hat{E}^D \hat{E} v_j + \int_0^t e^{\hat{E}^D \hat{A}(t-s)} \hat{E}^D \left( \hat{A}_d x_{j-1}(s) + \hat{B} u_j(s) \right) ds \\ &+ (\hat{E}^D \hat{E} - I) \left( \hat{A}^D \hat{A}_d x_{j-1}(t) + \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \hat{B} u_j^{(i)}(t) \right), \end{aligned} \quad (14) \quad \{\text{sol. formula non-advanced}\}$$

<sup>140</sup> Furthermore, the consistency condition at  $t = 0$  reads

$$(\hat{E}^D \hat{E} - I) \left( \varphi(0) + \hat{A}^D \hat{A}_d \varphi(-\tau) + \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \hat{B} u^{(i)}(0) \right) = 0. \quad (15) \quad \{\text{consistency}\}$$

<sup>141</sup> 2.2 A simple check for the non-advancedness

<sup>142</sup> Assume that the pair  $(E, A)$  is regular with index  $\text{ind}(E, A) = \nu$ . We want  
<sup>143</sup> to give a simple check whether the free system (2) is non-advanced or not. In  
<sup>144</sup> analogous to the case of DAEs Brenan et al. [1996], Kunkel and Mehrmann  
<sup>145</sup> [2006], we aim to extract the so-called *underlying delay equation* of the form

$$\dot{x}(t) = \bar{A}x(t) + \bar{A}_{d0}x(t-h) + \bar{A}_{d1}\dot{x}(t-h), \quad (16) \quad \{\text{underlying DDEs}\}$$

<sup>146</sup> from system (2) and its derivatives, which read in details

$$Ex^{(i)}(t) = \bar{A}x^{(i-1)}(t) + \bar{A}_d x^{(i-1)}(t-h), \text{ for all } i = 1, \dots, \nu.$$

We rewrite these equations into the so-called *inflated system*

$$\underbrace{\begin{bmatrix} E \\ -A & E \\ \ddots & \ddots & \\ & & -A & E \end{bmatrix}}_{\mathcal{E}} \begin{bmatrix} \dot{x} \\ \ddot{x} \\ \vdots \\ x^{(\nu+1)} \end{bmatrix} = \underbrace{\begin{bmatrix} A & 0 & \dots & 0 \\ 0 & 0 & \dots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \dots & 0 \end{bmatrix}}_{\mathcal{A}} \begin{bmatrix} x \\ \dot{x} \\ \vdots \\ x^{(\nu)} \end{bmatrix} + \underbrace{\begin{bmatrix} A_d & & & \\ & A_d & & \\ & & \ddots & \\ & & & A_d \end{bmatrix}}_{\mathcal{A}_d} \begin{bmatrix} x(t-h) \\ \dot{x}(t-h) \\ \vdots \\ x^{(\nu)}(t-h) \end{bmatrix}. \quad (17) \quad \{\text{inflated}\}$$

Here the matrix coefficients are  $\mathcal{E}, \mathcal{A}, \mathcal{A}_d \in \mathbb{R}^{(\nu+1)n, (\nu+1)n}$ . For the reader's convenience, below we will use MATLAB notations. System of the form (16) can be extracted from (17) if and only if there exists a matrix  $P = [P_0 \ P_1 \ \dots \ P_\nu]^T$  in  $\mathbb{R}^{(\nu+1)n, n}$  such that

$$\begin{aligned} P^T \mathcal{E} &= [I_n \ 0_{n, \nu n}] \\ P^T \mathcal{A}_d &= [* \ * \ 0_{n, (\nu-1)n}], \end{aligned}$$

<sup>147</sup> where  $*$  stands for an arbitrary matrix. Consequently,  $P$  is the solution to the  
<sup>148</sup> following linear systems

$$[\mathcal{E} \ \mathcal{A}(:, 2n+1 : end)]^T P = [I_n \ 0_{n, \nu n} \ 0_{n, (\nu-1)n}]^T. \quad (18) \quad \{\text{adv. check eq.}\}$$

<sup>149</sup> Therefore, making use of Crammer's rule we directly obtain the simple check  
<sup>150</sup> for the non-advancedness of system (2) in the following theorem.

<sup>151</sup> **Theorem 2** Consider the zero-input descriptor system (2) and assume that  
<sup>152</sup> the pair  $(E, A)$  is regular with index  $\text{ind}(E, A) = \nu$ . Then, this system is non-  
<sup>153</sup> advanced if and only if the following rank condition is satisfied

$$\text{rank} \left[ \begin{array}{c|c} \mathcal{E}^T & \\ \hline \mathcal{A}(:, 2n+1 : end)^T & \end{array} \right] = \text{rank} \left[ \begin{array}{c|c} \mathcal{E}^T & I_n \\ \hline \mathcal{A}(:, 2n+1 : end)^T & 0_{(2\nu-1)n, n} \end{array} \right]$$

<sup>154</sup> Theorem 2 applied to the index two case straightly gives us the following  
<sup>155</sup> corollary.

<sup>156</sup> **Corollary 3** Consider the zero-input descriptor system (2) and assume that  
<sup>157</sup> the pair  $(E, A)$  is regular with index  $\text{ind}(E, A) = 2$ . Then, system (2) is non-  
<sup>158</sup> advanced if and only if the following identity hold true.

$$\text{rank} \begin{bmatrix} E^T & -A^T & 0 \\ 0 & E^T & -A^T \\ 0 & 0 & A_d^T \end{bmatrix} = n + \text{rank} \begin{bmatrix} E^T & -A^T \\ 0 & E^T \\ 0 & A_d^T \end{bmatrix}. \quad (19) \quad \{\text{check advanced}\}$$

<sup>159</sup> *Example 2* Let us reconsider system (9) in Example 1. Numerical verification  
<sup>160</sup> of non-advancedness via condition (19) completely agrees with theoretical ob-  
<sup>161</sup> servation.

{thm check advancedness}

---

 162 2.3 Comparison principal

163 In this part of Section 2, we will show how to generalize our result to delay-  
 164 descriptor systems with time-varying delay of the following form

$$Ex(t) = Ax(t) + A_dx(t - \tau(t)) + Bu(t), \quad \text{for all } t \in [t_0, t_f], \quad (20) \quad \{\text{ltv delay-descriptor}\}$$

165 where the delay function  $\tau(t)$  is preassumed continuous and bounded, i.e.  
 166  $0 < \underline{\tau} \leq \tau(t) \leq \bar{\tau}$  for all  $t \geq 0$ . Here  $\underline{\tau}, \bar{\tau}$  are two positive constants. Following  
 167 Ha and Mehrmann [2016], it can be shown that the solution to system (20)  
 168 exists, unique and totally determined by any consistent initial function  $\varphi$  such  
 169 that  $x(t) = \varphi(t)$  for all  $-\bar{\tau} \leq t \leq 0$ . Indeed, also making use of the method  
 170 of steps, the solution  $x$  is constructively built on consecutive interval  $[t_{i-1}, t_i]$ ,  
 171  $i \in \mathbb{N}$  such that  $0 = t_0 < t_1 < t_2 < \dots$  and

$$t_i - \tau(t_i) = t_{i-1}.$$

172 As shown in Theorems 3, 4 below, we can directly generalize our result to  
 173 systems with bounded, time varying delay.

174 **Theorem 3** Consider system (1) and assume that the corresponding constant  
 175 delay system is positive and non-advanced. For a fixed input  $u$ , let  $x(t)$  (resp.  
 176  $\tilde{x}(t)$ ) be a state function corresponds to a preshape function  $\varphi(t)$  (resp.  $\tilde{\varphi}(t)$ ).  
 177 Furthermore, assume that  $\varphi(t) \leq \tilde{\varphi}(t)$  for all  $t \in [-\bar{\tau}, 0]$ . Then, we have  
 178  $x(t) \leq \tilde{x}(t)$  for all  $t \geq 0$ .

179 *Proof.* Since the input is fixed and the system is non-advanced, the proof can  
 180 be directly obtain as in the impulse-free case.  $\square$

181 **Theorem 4** Consider system (1) and assume that the corresponding constant  
 182 delay system positive. Furthermore, assume that  $(\hat{E}^D \hat{E} - I)(\hat{E}^D \hat{A})^i \hat{A}^D \hat{B} \geq 0$   
 183 for all  $i = 0, \dots, \nu - 1$ . Let  $x(t)$  (resp.  $\tilde{x}(t)$ ) be a state function corresponds to  
 184 a reference input  $u(t)$  (resp.  $\tilde{u}(t)$ ) and a preshape function  $\varphi(t)$  (resp.  $\tilde{\varphi}(t)$ ).  
 185 Furthermore, assume that the following conditions hold.  
 186 i)  $\varphi(t) \leq \tilde{\varphi}(t)$  for all  $t \in [-\bar{\tau}, 0]$ ,  
 187 ii)  $u^{(i)}(t) \leq \tilde{u}^{(i)}(t)$  for all  $t \geq 0$  and all  $i \leq (\nu - 1) \lfloor t/\bar{\tau} \rfloor$ . Then we have  
 188  $x(t) \leq \tilde{x}(t)$  for all  $t \geq 0$ .

189 *Proof.* The proof is also very simple.  $\square$

 190 3 Characterizations of positive delay-descriptor system

191 Since most systems occur in application are non-advanced, in this section we  
 192 focus on the characterization for positivity of non-advanced delay descriptor  
 193 systems. We, furthermore, notice that the non-advancedness is a necessary  
 194 condition for the stability (in the Lyapunov sense) of any time-delayed system,  
 195 see e.g. Hale and Lunel [1993], Du et al. [2013].

{sec2b}

{solution comparison 1}

{solution comparison 2}

{sec3}

196 **Definition 5** Consider the delay-descriptor system (1) and assume that it is  
197 non-advanced, and that the pair  $(E, A)$  is regular with  $\text{ind}(E, A) = \nu$ . We call  
198 (1) positive if for all  $t \geq 0$  we have  $x(t) \geq 0$  and  $y(t) \geq 0$  for any input function  
199  $u$  and any consistent initial function  $\varphi(t)$  that satisfy two following conditions.  
200 i)  $\varphi(t) \geq 0$  for all  $t \in [-\tau, 0]$ ,  
201 ii)  $u^{(i)}(t) \geq 0$  for all  $t \geq 0$  and all  $i \leq (\nu - 1) \lfloor t/\tau \rfloor$ .

202 Let us denote

$$\mathcal{K}_\nu(\hat{E}\hat{A}^D, \hat{A}^D\hat{B}) := [\hat{A}^D\hat{B}, \hat{E}\hat{A}^D\hat{A}^D\hat{B}, \dots, (\hat{E}\hat{A}^D)^{\nu-1}\hat{A}^D\hat{B}] .$$

Since our systems is linear, time invariant coefficients, it would be sufficient to study the positivity on the first time interval  $[0, \tau]$ . Making use of (14), and let  $j = 1$ , we can split the solution  $x_1 = x|_{[0, \tau]}$  as follows

$$\begin{aligned} x_1(t) &= e^{\hat{E}^D\hat{A}t}\hat{E}^D\hat{E}v_1 + \underbrace{\int_0^t e^{\hat{E}^D\hat{A}(t-s)}\hat{E}^D\hat{A}_d x_0(s) + (\hat{E}^D\hat{E} - I)\hat{A}^D\hat{A}_d x_0(t)}_{x_{zi}(t)} \\ &\quad + \underbrace{\int_0^t e^{\hat{E}^D\hat{A}(t-s)}\hat{E}^D\hat{B}u_j(s) + (\hat{E}^D\hat{E} - I)\sum_{i=0}^{\nu-1}(\hat{E}^D\hat{A})^i\hat{A}^D\hat{B}u_j^{(i)}(t)}_{x_{zs}(t)}, \end{aligned} \tag{21} \quad \{\text{eq16}\}$$

203 where  $x_{zi}(t)$  (resp.  $x_{zs}(t)$ ) is often called (in the theory of linear systems) the  
204 zero input (resp. zero state) solution.

205 **Lemma 2** Let  $F \in \mathbb{R}^{p,n}$  and  $M \in \mathbb{R}^{n,n}$  and consider the linear system  $\dot{z}(t) =$   
206  $Mz(t)$ . Then, the following implication holds true:

$$[Fz(0) \geq 0] \Rightarrow [Fz(t) \geq 0 \text{ for all } t \geq 0]$$

207 if and only if there exists a Metzler matrix  $H$  such that  $FM = HF$ .

208 **Proposition 1** Rami and Napp [2012] The following statements are equivalent. 209 \{\text{Rami12}\}

- 210 i) The differential-algebraic equation  $E\dot{x}(t) = Ax(t)$  is positive.
- 211 ii) There exists a Metzler matrix  $H$  such that  $\hat{E}^D\hat{A} = H\hat{E}^D\hat{E}$ .
- 212 iii) There exists a matrix  $D$  such that  $H := \bar{A} + D(I - P)$  is Metzler.

213 **Lemma 3** Consider the delay-descriptor system (1) and assume that it is  
214 non-advanced, and the pair  $(E, A)$  is regular with index  $\text{ind}(E, A) = \nu$ . Let the  
215 input  $u = 0$ . Then, system (1) has a solution  $x(t) \geq 0$  for all  $t \geq 0$  and all  
216 consistent initial function  $\varphi(t) \geq 0$  if and only if the following conditions are  
217 satisfied.

- 218 i) There exists a Metzler matrix  $H$  s.t.  $\hat{E}^D\hat{A} = H\hat{E}^D\hat{E}$ .
- 219 ii)  $\hat{E}^D\hat{A}_d \geq 0$ ,  $(\hat{E}^D\hat{E} - I)\hat{A}^D\hat{A}_d \geq 0$ .

\{\text{Castelan'93}\}

\{\text{zero input lemma}\}

220 **Theorem 5** Consider the delay-descriptor system (1) and assume that it is  
221 non-advanced, and the pair  $(E, A)$  is regular with index  $\text{ind}(E, A) = \nu$ . Furthermore,  
222 assume that  $(\hat{E}^D \hat{E} - I) (\hat{E}^D \hat{A})^i \hat{A}^D \hat{B} \geq 0$  for all  $i = 0, \dots, \nu - 1$ .  
223 Then, system (1) is positive if and only if the following conditions hold.

- 224 i)  $\hat{E}^D \hat{A} = H \hat{E}^D \hat{E}$  for some Metzler matrix  $H$ .
- 225 ii)  $\hat{E}^D \hat{A}_d \geq 0$ ,  $(\hat{E}^D \hat{E} - I) \hat{A}^D \hat{A}_d \geq 0$ ,  $\hat{E}^D \hat{B} \geq 0$ ,
- 226 iii)  $C$  is non-negative on the subspace

$$\mathcal{X} := \text{im}_+ \left[ \hat{E}^D \hat{E}, (\hat{E}^D \hat{E} - I) \hat{A}^D \hat{A}_d, (\hat{E}^D \hat{E} - I) \mathcal{K}_\nu(\hat{E} \hat{A}^D, \hat{A}^D \hat{B}) \right]. \quad (22) \quad \{\text{reachable subspace}\}$$

227 *Proof.*  $\Rightarrow$  Due to Lemma 3, we only need to prove part 3.

228  $\Leftarrow$  Quite simple.  $\square$

229 If we restrict ourself to the non-delayed case (i.e.  $A_d = 0$ ), the direct corol-  
230 lary of Theorem 5 is straightforward. We, moreover, notice that this corollary  
231 has slightly improved the result [Virnik, 2008, Thm. 3.4].

232 **Corollary 4** Consider the descriptor system (3) and assume that the pair  
233  $(E, A)$  is regular with index  $\text{ind}(E, A) = \nu$ . Furthermore, assume that the  
234 inequalities  $(\hat{E}^D \hat{E} - I) (\hat{E}^D \hat{A})^i \hat{A}^D \hat{B} \geq 0$  hold true for  $i = 0, \dots, \nu - 1$ .  
235 Then, system (3) is positive if and only if the following conditions hold.  
236 i)  $\hat{E}^D \hat{A} = H \hat{E}^D \hat{E}$  for some Metzler matrix  $H$ .  
237 ii)  $\hat{E}^D \hat{B} \geq 0$ ,  
238 iii)  $C$  is non-negative on the subspace  $\mathcal{X}$ .

## 239 4 Stability of positive delay-descriptor system

## 240 5 Conclusion

241 In this paper, we have discussed the positivity of strangeness-free descrip-  
242 tor systems in continuous time. Beside that, the characterization of positive  
243 delay-descriptor systems has been treated as well. The theoretical results are  
244 obtained mainly via an algebraic approach and a projection approach. The  
245 projection approach investigates the positivity of a given descriptor system  
246 by the positivity of an inherent ODE obtained by projecting the given sys-  
247 tem onto a subspace. On the other hand, the algebraic approach derives an  
248 underlying ODE without changing the state, input and output. Then, study-  
249 ing these hidden ODEs is the key point. The main difficulty here is that the  
250 derivative of the input  $u$  may occur in the new system. Despite their disad-  
251 vantages, these methods can provide both necessary conditions and sufficient  
252 conditions. Beside these theoretical methods, the behaviour approach, which  
253 leads to some feasible conditions, is also implemented.

254 **Acknowledgment** The author would like to thank the anonymous referee  
255 for his suggestions to improve this paper.
