6 Abstract This paper deals with the stability analysis of positive delay-descrip-
 7 tor systems with arbitrarily high index. First we discuss the solvability problem
 8 (i.e., about the existence and uniqueness of a solution), which is followed by
 9 the study on characterizations of the (internal) positivity. Finally, we discuss
 10 the stability analysis. Numerically verifiable conditions in terms of matrix in-
 11 equality for the system's coefficients are proposed, and are examined in several
 12 examples.

13 Keywords Positivity · Delay · Descriptor systems · Strangeness-index .

14 Nomenclature

\mathbb{N} (\mathbb{N}_0)	the set of natural numbers (including 0)
\mathbb{R} (\mathbb{C})	the set of real (complex) numbers
\mathbb{C}_-	the set $\{\lambda \in \mathbb{C} \mid \operatorname{Re}\lambda < 0\}$
I (I_n)	the identity matrix (of size $n \times n$)
$x^{(j)}$	the j -th derivative of a function x
$C^p([-\tau, 0], \mathbb{R}^n)$	the space of p -times continuously differentiable functions from $[-\tau, 0]$ to \mathbb{R}^n (for $0 \leq p \leq \infty$)
$\ \cdot\ _\infty$	the norm of the Banach space $C^0([-\tau, 0], \mathbb{R}^n)$
$\operatorname{im}_+ W$	the space $\{Ww_1 \text{ for all } w_1 \in \mathbb{R}_+^n\}$
$\mathcal{K}(U, W)$	the matrix $\mathcal{K}(U, W) := [W, UW, \dots, U^{\nu-1}W]$.

16 1 Introduction

Our focus in the present paper is on the positivity and stability analysis of linear, constant coefficients *delay-descriptor systems* of the form

$$\begin{aligned} E\dot{x}(t) &= Ax(t) + A_dx(t - \tau) + Bu(t), \quad \text{for all } t \in [t_0, t_f], \\ y(t) &= Cx(t), \end{aligned} \quad \{ \text{sec1} \} \quad (1) \quad \{\text{delay-descriptor}\}$$

¹⁷ where $E, A \in \mathbb{R}^{n,n}$, $B \in \mathbb{R}^{n,p}$, $C \in \mathbb{R}^{q,n}$, $x : [t_0 - \tau, t_f] \rightarrow \mathbb{R}^n$, $f : [t_0, t_f] \rightarrow \mathbb{R}^n$,
¹⁸ and $\tau > 0$ is a constant delay. Together with (1), we are also concern with
¹⁹ the associated *zero-input/free system*

$$E\dot{x}(t) = Ax(t) + A_dx(t - \tau), \quad \text{for all } t \in [t_0, t_f]. \quad (2) \quad \{\text{free system}\}$$

²⁰ Systems of the form (1) can be considered as a general combination of two
²¹ important classes of dynamical systems, namely *differential-algebraic equations*
²² (*descriptor systems*) (DAEs)

$$E\dot{x}(t) = Ax(t) + Bu(t), \quad (3) \quad \{\text{eq1.2}\}$$

²³ where the matrix E is allowed to be singular ($\det E = 0$), and *delay-differential*
²⁴ *equations* (DDEs)

$$\dot{x}(t) = Ax(t) + A_dx(t - \tau) + Bu(t). \quad (4) \quad \{\text{eq1.3}\}$$

²⁵ Delay-descriptor systems of the form (1) have been arisen in various applica-
²⁶ tions, see Ascher and Petzold [1995], Campbell [1980], Hale and Lunel [1993],
²⁷ Shampine and Gahinet [2006], Zhu and Petzold [1997] and the references there
²⁸ in. From the theoretical viewpoint, the study for such systems is much more
²⁹ complicated than that for standard DDEs or DAEs. The dynamics of DDAEs
³⁰ has been strongly enriched, and many interesting properties, which occur nei-
³¹ ther for DAEs nor for DDEs, have been observed for DDAEs Campbell [1995],
³² Du et al. [2013], Ha and Mehrmann [2012, 2016]. Due to these reasons, re-
³³ cently more and more attention has been devoted to DDAEs, Campbell and
³⁴ Linh [2009], Fridman [2002], Ha and Mehrmann [2012, 2016], Michiels [2011],
³⁵ Shampine and Gahinet [2006], Tian et al. [2014], Linh and Thuan [2015].

³⁶
³⁷ $[....]$
³⁸

³⁹ The short outline of this work is as follows. Firstly, in Section 2, we briefly
⁴⁰ recall the solvability analysis to system (1), followed by a result about solution
⁴¹ comparison for the free system (2) (Theorem 3). Based on the explicit solution
⁴² representation in Section 2, we present a characterization for the positivity of
⁴³ system (1) in Section 3. Algebraic, numerically verifiable conditions in terms
⁴⁴ of the system matrix coefficients are established there. To follow, in Section 4
⁴⁵ we discuss further about the free system (2) under biconditional requirements:
⁴⁶ stability and positivity. Finally, we conclude this research with some discussion
⁴⁷ and open questions.

48 2 Preliminaries

49 In this section we discuss the solvability analysis, including the solution representation and the comparison principal for the corresponding IVP to system
 50 (1), which consists of (1) together with an initial condition

$$x|_{[t_0-\tau, t_0]} = \varphi : [t_0 - \tau, t_0] \rightarrow \mathbb{R}^n. \quad (5) \quad \{\text{sec2}\}$$

52 Here, φ is a prescribed initial trajectory (preshape function), which is necessary
 53 to achieve uniqueness of solutions. Without loss of generality, we assume that
 54 $t_0 = 0$ and $t_f = n_f\tau$, where $n_f \in \mathbb{N}$.

55 2.1 Existence, uniqueness and explicit solution formula

56 It is well-known (e.g. Du et al. [2013]) that we may consider different solution
 57 concepts for system (1). The reason is, that $E(0)\dot{x}(0^+)$ which arises from the
 58 right hand side in (1) at 0 may not be equal to $E(0)\dot{\varphi}(0^-)$. Moreover, it has
 59 been observed in Baker et al. [2002], Campbell [1980], Guglielmi and Hairer
 60 [2008] that a discontinuity of \dot{x} at $t = 0$ may propagate with time, and typically
 61 \dot{x} is discontinuous at every point $j\tau$, $j \in \mathbb{N}_0$ or it may not even exist. To deal
 62 with this property of DDAEs, we use the following solution concept.

63 **Definition 1** Let us consider a fixed input function $u(t)$. {solution}

- 64 i) A function $x : [-\tau, \infty) \rightarrow \mathbb{R}^n$ is called a *piecewise differentiable solution* of
 65 (1), if Ex is piecewise continuously differentiable, x is continuous and satisfies
 66 (1) at every $t \in [t_0, t_f) \setminus \bigcup_{j \in \mathbb{N}_0} \{j\tau\}$.
- 67 ii) A function $x : [-\tau, \infty) \rightarrow \mathbb{R}^n$ is called a *classical solution* of (1) if it is at
 68 least continuous and satisfies (1) at every $t \in [t_0, t_f]$.

69 Throughout this paper whenever we speak of a solution, we mean a piece-
 70 wise differentiable solution. Notice that, like DAEs, DDAEs are not solvable
 71 for arbitrary initial conditions, but they have to obey certain consistency con-
 72 ditions.

73 **Definition 2** An initial function φ is called *consistent* with (1) if the associ-
 74 ated initial value problem (IVP) (1), (5) has at least one solution. System (1)
 75 is called *solvable* (resp. *regular*) if for every consistent initial function φ , the
 76 IVP (1), (5) has a solution (resp. has a unique solution).

Introducing sequences of matrix-valued and vector-valued functions f_j , u_j ,
 x_j for each $j \in \mathbb{N}$, on the time interval $[0, \tau]$ via

$$\begin{aligned} f_j(t) &= f(t + (j-1)\tau), \quad u_j(t) = u(t + (j-1)\tau), \\ x_j(t) &= x(t + (j-1)\tau), \quad x_0(t) := \varphi(t - \tau), \end{aligned}$$

77 we can rewrite the IVP (1)-(5) as a sequence of non-delayed descriptor systems

$$E\dot{x}_j(t) = Ax_j(t) + A_dx_{j-1}(t) + Bu_j(t), \quad (6) \quad \{\text{j-th DAE}\}$$

78 for all $t \in (0, \tau)$ and for all $j = 1, 2, \dots, n_f$. We notice, that for each j , the
 79 initial condition $x_j(0)$ is given due to the continuity of the solution $x(t)$ at the
 80 point $(j-1)\tau$, i.e.,

$$x_j(0) = x_{j-1}(\tau) . \quad (7) \quad \{\text{continuity condition}\}$$

81 In particular, $x_1(0) = \phi(0)$ and the function x_0 is given.

82
 83 It is well-known (see e.g. Bellman and Cooke [1963], Hale and Lunel [1993])
 84 that in general, time-delayed systems has been classified into three different
 85 types (retarded, neutral, advanced). For example, the time-delayed equation

$$a_0\dot{x}(t) + a_1\dot{x}(t - \tau) + b_0x(t) + b_1x(t - \tau) = f(t)$$

86 is retarded if $a_0 \neq 0$ and $a_1 = 0$; is neutral if $a_0 \neq 0$, $a_1 \neq 0$; is advanced
 87 if $a_0 = 0$, $a_1 \neq 0$, $b_0 \neq 0$. Obviously, this classification is based on the
 88 smoothness comparison between $x(t)$ and $x(t - \tau)$. In literature, not only
 89 the theoretical but also numerical solution has been studied mainly for non-
 90 advanced systems (i.e., retarded or neutral), due to their appearance in various
 91 applications. For this reason, in Ha [2015], Ha and Mehrmann [2016], Unger
 92 [2018] the authors proposed a concept of *non-advancedness* for (1) (see Definition
 93 below). We also notice, that even though not clearly proposed, due to
 94 the author's knowledge, so far results for delay-descriptor are only obtained
 95 for certain classes of non-advanced systems, e.g. Ascher and Petzold [1995],
 96 Shampine and Gahinet [2006], Zhu and Petzold [1997, 1998], Michiels [2011].

97 **Definition 3** A regular delay-descriptor system (1) is called *non-advanced* if
 98 for any consistent and continuous initial function φ , there exists a piecewise
 99 differentiable solution $x(t)$ to the IVP (1), (5).

100 **Definition 4** Consider the DDAE (1). The matrix triple (E, A, B) is called
 101 *regular* if the (two variable) *characteristic polynomial* $\det(\lambda E - A - \omega B)$ is
 102 not identically zero. If, in addition, $B = 0$ we say that the matrix pair (E, A)
 103 (or the pencil $\lambda E - A$) is regular. The sets $\sigma(E, A, B) := \{\lambda \in \mathbb{C} \mid \det(\lambda E -$
 104 $A - e^{-\lambda\tau}B) = 0\}$ and $\rho(E, A, B) = \mathbb{C} \setminus \sigma(E, A, B)$ are called the *spectrum* and
 105 the *resolvent set* of (1), respectively.

106 Provided that the pair (E, A) is regular, we can transform them to the
 107 Kronecker-Weierstraß canonical form (see e.g. Dai [1989], Kunkel and Mehrmann
 108 [2006]). That is, there exist regular matrices $W, T \in \mathbb{R}^{n,n}$ such that

$$(E, A) = \left(W \begin{bmatrix} I & 0 \\ 0 & N \end{bmatrix} T, W \begin{bmatrix} J & 0 \\ 0 & I \end{bmatrix} T \right) , \quad (8) \quad \{\text{KW form}\}$$

109 where N is a nilpotent matrix of nilpotency index ν . We also say that the pair
 110 (E, A) has a *differentiation index* ν , i.e., $\text{ind}(E, A) = \nu$.

111 *Remark 1* Two concepts non-advancedness and differentiation index are inde-
 112 pendent. In details, a non-advanced system can have arbitrarily high index, as
 113 can be seen in the following example.

{def2}

{regularity}

¹¹⁴ Example 1 Consider the following systems with the parameters $\varepsilon_1, \varepsilon_2$. {example 1}

$$\underbrace{\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}}_E \dot{x}(t) = \underbrace{\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}}_A x(t) + \underbrace{\begin{bmatrix} 0 & \varepsilon_1 \\ 0 & \varepsilon_2 \end{bmatrix}}_{A_d} x(t - \tau). \quad (9) \quad \{\text{eq11}\}$$

¹¹⁵ It is well-known that in this example $\text{ind}(E, A) = 2$. Furthermore, depending
¹¹⁶ on the value of ε_2 , the system will be advanced (if $\varepsilon_2 \neq 0$) and be non-advanced
¹¹⁷ (if $\varepsilon_2 = 0$). Analogously, one can construct a non-advanced system which has
¹¹⁸ an arbitrarily high index.

¹¹⁹ Let E have index $\tilde{\nu}$, i.e., $\text{ind}(E, I_n) = \tilde{\nu}$, the Drazin inverse E^D of E is
¹²⁰ uniquely defined by the properties

$$E^D E = E E^D, \quad E^D E E^D = E^D, \quad E^D E^{\tilde{\nu}+1} = E^{\tilde{\nu}}. \quad (10) \quad \{\text{Drazin property}\}$$

¹²¹ Lemma 1 Kunkel and Mehrmann [2006] Let (E, A) be a regular matrix pair. {lem1}
¹²² Then for any $\lambda \in \rho(E, A)$, two following matrices commute.

$$\hat{E} := (\lambda E - A)^{-1} E, \quad \hat{A} := (\lambda E - A)^{-1} A. \quad (11) \quad \{\text{eq20}\}$$

¹²³ Furthermore, the following commutative identities hold true.

$$\hat{E} \hat{A}^D = \hat{A}^D \hat{E}, \quad \hat{E}^D \hat{A} = \hat{A} \hat{E}^D, \quad \hat{E}^D \hat{A}^D = \hat{A}^D \hat{E}^D. \quad (12) \quad \{\text{eq12}\}$$

¹²⁴ We notice that the matrix products $\hat{E}^D \hat{E}$, $\hat{E}^D \hat{A}$, $\hat{E} \hat{A}^D$, $\hat{E}^D \hat{B}$, $\hat{A}^D \hat{B}$ do
¹²⁵ not depend on the choice of λ (see e.g. Dai [1989]). Furthermore, they can
¹²⁶ be numerically computed by transforming the pair (E, A) to their Weierstrass
¹²⁷ canonical form (8) (see e.g. Varga [2019], Virnik [2008]).

¹²⁸ For any $\lambda \in \rho(E, A)$, we denote

$$\hat{A}_d := (\lambda E - A)^{-1} A_d, \quad \hat{B} := (\lambda E - A)^{-1} B. \quad (13) \quad \{\text{eq21}\}$$

¹²⁹ Making use of the Drazin inverse, in the following theorem we present the
¹³⁰ explicit solution representation of system (1).

Theorem 1 Consider the delay-descriptor system (1). Assume that (E, A) is
a regular matrix pair with a differentiation index $\text{ind}(E, A) = \nu$. Let \hat{E} , \hat{A} ,
 \hat{A}_d , \hat{B} be defined as in (11), (13). Furthermore, assume that u is sufficiently
smooth. Then, every solution x_j of the DAE (6) has the form

$$\begin{aligned} x_j(t) &= e^{\hat{E}^D \hat{A} t} \hat{E}^D \hat{E} v_j + \int_0^t e^{\hat{E}^D \hat{A}(t-s)} \hat{E}^D \left(\hat{A}_d x_{j-1}(s) + \hat{B} u_j(s) \right) ds \\ &+ (\hat{E}^D \hat{E} - I) \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \left(\hat{A}_d x_{j-1}^{(i)}(t) + \hat{B} u_j^{(i)}(t) \right), \end{aligned} \quad (14) \quad \{\text{j-th solution}\}$$

¹³¹ for some vector $v_j \in \mathbb{R}^n$.

{sol. rep. DAE}

¹³² *Proof.* The proof is straightly followed from the explicit solution of DAEs, see
¹³³ [Kunkel and Mehrmann, 2006, Chap. 2]. \square

¹³⁴ Making use of (7), we directly obtain the following corollary.

¹³⁵ **Corollary 1** *The solution $x(t)$ of system (1) is continuous at the point $(j-1)\tau$
¹³⁶ if and only if the following condition holds.*

$$(\hat{E}^D \hat{E} - I) x_{j-1}(\tau) = (\hat{E}^D \hat{E} - I) \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \left(\hat{A}_d x_{j-1}^{(i)}(0) + \hat{B} u_j^{(i)}(0) \right) .$$

¹³⁷ In particular, for the preshape function $\varphi(t)$, we must require

$$(\hat{E}^D \hat{E} - I) \left(\varphi(0) + \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \left(\hat{A}_d \varphi^{(i)}(-\tau) + \hat{B} u^{(i)}(0) \right) \right) = 0 .$$

¹³⁸ Following from (14), we directly obtain a simpler form in case of non-
¹³⁹ advanced system as follows.

Corollary 2 *Consider system (1) and assume that it is regular and non-advanced. Then, we have*

$$\begin{aligned} x_j(t) &= e^{\hat{E}^D \hat{A} t} \hat{E}^D \hat{E} v_j + \int_0^t e^{\hat{E}^D \hat{A}(t-s)} \hat{E}^D \left(\hat{A}_d x_{j-1}(s) + \hat{B} u_j(s) \right) ds \\ &+ (\hat{E}^D \hat{E} - I) \left(\hat{A}^D \hat{A}_d x_{j-1}(t) + \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \hat{B} u_j^{(i)}(t) \right), \end{aligned} \quad (15) \quad \{\text{sol. formula non-advanced}\}$$

¹⁴⁰ Furthermore, the consistency condition at $t = 0$ reads

$$(\hat{E}^D \hat{E} - I) \left(\varphi(0) + \hat{A}^D \hat{A}_d \varphi(-\tau) + \sum_{i=0}^{\nu-1} (\hat{E}^D \hat{A})^i \hat{A}^D \hat{B} u^{(i)}(0) \right) = 0 . \quad (16) \quad \{\text{consistency}\}$$

¹⁴¹ 2.2 A simple check for the non-advancedness

¹⁴² Assume that the pair (E, A) is regular with index $\text{ind}(E, A) = \nu$. We want
¹⁴³ to give a simple check whether the free system (2) is non-advanced or not. In
¹⁴⁴ analogous to the case of DAEs Brenan et al. [1996], Kunkel and Mehrmann
¹⁴⁵ [2006], we aim to extract the so-called *underlying delay equation* of the form

$$\dot{x}(t) = \mathbf{A}x(t) + \mathbf{A}_{d0}x(t-h) + \mathbf{A}_{d1}\dot{x}(t-h), \quad (17) \quad \{\text{underlying DDEs}\}$$

¹⁴⁶ from an augmented system consisting of system (2) and its derivatives, which
¹⁴⁷ read in details

$$\frac{d^i}{dt^i} (E\dot{x}(t) - Ax(t) - A_dx(t-\tau)) = 0, \text{ for all } i = 0, 1, \dots, \nu.$$

We rewrite these equations into the so-called *inflated system*

$$\underbrace{\begin{bmatrix} E \\ -A & E \\ \ddots & \ddots & \\ & & -A & E \end{bmatrix}}_{\mathcal{E}} \begin{bmatrix} \dot{x} \\ \ddot{x} \\ \vdots \\ x^{(\nu+1)} \end{bmatrix} = \underbrace{\begin{bmatrix} A & 0 & \dots & 0 \\ 0 & 0 & \dots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \dots & 0 \end{bmatrix}}_{\mathcal{A}} \begin{bmatrix} x \\ \dot{x} \\ \vdots \\ x^{(\nu)} \end{bmatrix} + \underbrace{\begin{bmatrix} A_d & & & \\ & A_d & & \\ & & \ddots & \\ & & & A_d \end{bmatrix}}_{\mathcal{A}_d} \begin{bmatrix} x(t-h) \\ \dot{x}(t-h) \\ \vdots \\ x^{(\nu)}(t-h) \end{bmatrix}. \quad (18) \quad \{\text{inflated}\}$$

Here the matrix coefficients are $\mathcal{E}, \mathcal{A}, \mathcal{A}_d \in \mathbb{R}^{(\nu+1)n, (\nu+1)n}$. For the reader's convenience, below we will use MATLAB notations. An underlying delay system (17) can be extracted from (18) if and only if there exists a matrix $P = [P_0 \ P_1 \ \dots \ P_\nu]^T$ in $\mathbb{R}^{(\nu+1)n, n}$ such that

$$P^T \mathcal{E} = [I_n \ 0_{n, \nu n}], \\ P^T \mathcal{A}_d = [* \ * \ 0_{n, (\nu-1)n}],$$

¹⁴⁸ where $*$ stands for an arbitrary matrix. Consequently, P is the solution to the
¹⁴⁹ following linear systems

$$[\mathcal{E} \ \mathcal{A}_d(:, 2n+1 : end)]^T P = [I_n \ 0_{n, \nu n} \ 0_{n, (\nu-1)n}]^T.$$

¹⁵⁰ Therefore, making use of Crammer's rule we directly obtain the simple check
¹⁵¹ for the non-advancedness of system (2) in the following theorem.

¹⁵² **Theorem 2** Consider the zero-input descriptor system (2) and assume that
¹⁵³ the pair (E, A) is regular with index $\text{ind}(E, A) = \nu$. Then, this system is non-
¹⁵⁴ advanced if and only if the following rank condition is satisfied

$$\text{rank} \left[\begin{array}{c|c} \mathcal{E}^T & \\ \hline \mathcal{A}_d(:, 2n+1 : end)^T & \end{array} \right] = \text{rank} \left[\begin{array}{c|c} \mathcal{E}^T & I_n \\ \mathcal{A}_d(:, 2n+1 : end)^T & 0_{(2\nu-1)n, n} \end{array} \right] \quad (19) \quad \{\text{adv. check eq.}\}$$

¹⁵⁵ Theorem 2 applied to the index two case straightly gives us the following
¹⁵⁶ corollary.

¹⁵⁷ **Corollary 3** Consider the zero-input descriptor system (2) and assume that
¹⁵⁸ the pair (E, A) is regular with index $\text{ind}(E, A) = 2$. Then, system (2) is non-
¹⁵⁹ advanced if and only if the following identity hold true.

$$\text{rank} \left[\begin{array}{ccc} E^T & -A^T & 0 \\ 0 & E^T & -A^T \\ 0 & 0 & A_d^T \end{array} \right] = n + \text{rank} \left[\begin{array}{cc} E^T & -A^T \\ 0 & E^T \\ 0 & A_d^T \end{array} \right]. \quad (20) \quad \{\text{check advanced}\}$$

¹⁶⁰ *Example 2* Let us reconsider system (9) in Example 1. Numerical verification
¹⁶¹ of non-advancedness via condition (20) completely agrees with theoretical ob-
¹⁶² servation.

₁₆₃ 2.3 Comparison principal

₁₆₄ In this part of Section 2, we will show how to generalize our result to delay-
₁₆₅ descriptor systems with time-varying delay of the following form

$$Ex(t) = Ax(t) + A_d x(t - \tau(t)) + Bu(t), \quad \text{for all } t \in [t_0, t_f], \quad (21) \quad \{\text{ltv delay-descriptor}\}$$

₁₆₆ where the delay function $\tau(t)$ is preassumed continuous and bounded, i.e.
₁₆₇ $0 < \underline{\tau} \leq \tau(t) \leq \bar{\tau}$ for all $t \geq 0$. Here $\underline{\tau}, \bar{\tau}$ are two positive constants. Following
₁₆₈ Ha and Mehrmann [2016], it can be shown that the solution to system (21)
₁₆₉ exists, unique and totally determined by any consistent initial function φ such
₁₇₀ that $x(t) = \varphi(t)$ for all $-\bar{\tau} \leq t \leq 0$. Indeed, also making use of the method
₁₇₁ of steps, the solution x is constructively built on consecutive interval $[t_{i-1}, t_i]$,
₁₇₂ $i \in \mathbb{N}$ such that $0 = t_0 < t_1 < t_2 < \dots$ and

$$t_i - \tau(t_i) = t_{i-1}.$$

₁₇₃ As shown in Theorems 3, 4 below, we can directly generalize our result to
₁₇₄ systems with bounded, time varying delay.

₁₇₅ **Theorem 3** Consider system (21) and assume that the corresponding con-
₁₇₆ stant delay system (1) is positive and non-advanced. For a fixed input u , let
₁₇₇ $x(t)$ (resp. $\tilde{x}(t)$) be a state function corresponds to a preshape function $\varphi(t)$
₁₇₈ (resp. $\tilde{\varphi}(t)$). Furthermore, assume that $\varphi(t) \leq \tilde{\varphi}(t)$ for all $t \in [-\bar{\tau}, 0]$. Then,
₁₇₉ we have $x(t) \leq \tilde{x}(t)$ for all $t \geq 0$.

₁₈₀ *Proof.* Based on the linearity of system (1), $\tilde{x}(t) - x(t)$ satisfies the free system
₁₈₁ (2). Furthermore, since this system is non-advanced and positive the non-
₁₈₂ negativity of $\tilde{\varphi}(t) - \varphi(t)$ implies that $\tilde{x}(t) - x(t) \geq 0$ for all t . \square

₁₈₃ **Theorem 4** Consider system (21) and assume that the corresponding con-
₁₈₄ stant delay system (1) is positive. Furthermore, assume that

$$(\hat{E}^D \hat{E} - I) (\hat{E}^D \hat{A})^i \hat{A}^D \hat{B} \geq 0$$

₁₈₅ for all $i = 0, \dots, \nu - 1$. Let $x(t)$ (resp. $\tilde{x}(t)$) be a state function corresponds to
₁₈₆ a reference input $u(t)$ (resp. $\tilde{u}(t)$) and a preshape function $\varphi(t)$ (resp. $\tilde{\varphi}(t)$).
₁₈₇ Then we have $x(t) \leq \tilde{x}(t)$ for all $t \geq 0$, provided that the following conditions
₁₈₈ are fulfilled.
₁₈₉ i) $\varphi(t) \leq \tilde{\varphi}(t)$ for all $t \in [-\bar{\tau}, 0]$,
₁₉₀ ii) $u^{(i)}(t) \leq \tilde{u}^{(i)}(t)$ for all $t \geq 0$ and for all $i \leq (\nu - 1) \lfloor t/\bar{\tau} \rfloor$.

₁₉₁

₁₉₂ *Proof.* The proof is also straightforward from the solution's representation
₁₉₃ (14). \square

₁₉₄ From Theorems 3, 4 above, we see that the time varying delay will affect
₁₉₅ neither the positivity nor the stability of system (1).

{solution comparison 2}

196 3 Characterizations of positive delay-descriptor system

197 Since most systems occur in application are non-advanced, in this section we
 198 focus on the characterization for positivity of non-advanced delay descriptor
 199 systems. We, furthermore, notice that the non-advancedness is a necessary
 200 condition for the stability (in the Lyapunov sense) of any time-delayed system,
 201 see e.g. Hale and Lunel [1993], Du et al. [2013].

202 **Definition 5** Consider the delay-descriptor system (1) and assume that it is
 203 non-advanced, and that the pair (E, A) is regular with $\text{ind}(E, A) = \nu$. We call
 204 (1) positive if for all $t \geq 0$ we have $x(t) \geq 0$ and $y(t) \geq 0$ for any input function
 205 u and any consistent initial function $\varphi(t)$ that satisfy two following conditions.
 206 i) $\varphi(t) \geq 0$ for all $t \in [-\tau, 0]$,
 207 ii) $u^{(i)}(t) \geq 0$ for all $t \geq 0$ and all $i \leq (\nu - 1) \lfloor t/\tau \rfloor$.

208 For nontiaonal convenience, let us denote by

$$P := \hat{E}^D \hat{E}, \quad \bar{\mathbf{A}} := \hat{E}^D \hat{A}, \quad \bar{\mathbf{A}}_d := \hat{E}^D \hat{A}_d, \quad \bar{\mathbf{B}} := \hat{E}^D \hat{B}, \quad (22) \quad \{\text{can. proj}\}$$

$$\mathcal{K}_\nu(\bar{\mathbf{A}}, \hat{A}^D \hat{B}) := [\hat{A}^D \hat{B}, \bar{\mathbf{A}} \hat{A}^D \hat{B}, \dots, \bar{\mathbf{A}}^{\nu-1} \hat{A}^D \hat{B}] .$$

Since our systems is linear, time invariant coefficients, it would be sufficient to study the positivity on the first time interval $[0, \tau]$. Making use of (15), and let $j = 1$, we can split the solution $x_1 = x|_{[0, \tau]}$ as follows

$$x_1(t) = \underbrace{e^{\bar{\mathbf{A}}t} P x_0(\tau) + (P - I) \hat{A}^D \hat{A}_d x_0(t) + \int_0^t e^{\bar{\mathbf{A}}(t-s)} \bar{\mathbf{A}}_d x_0(s) ds}_{x_{zi}(t)}$$

$$+ \underbrace{\int_0^t e^{\bar{\mathbf{A}}(t-s)} \bar{\mathbf{B}} u_j(s) ds + (P - I) \sum_{i=0}^{\nu-1} \bar{\mathbf{A}}^i \hat{A}^D \hat{B} u_j^{(i)}(t)}_{x_{zs}(t)} . \quad (23) \quad \{\text{eq16}\}$$

209 In the theory of linear systems, $x_{zi}(t)$ (resp. $x_{zs}(t)$) is often called the zero
 210 *input/free* (resp. *zero state*) solution.

211 **Lemma 2** Let $F \in \mathbb{R}^{p,n}$, $M \in \mathbb{R}^{n,n}$ and the system $\dot{z}(t) = Mz(t)$. Then, the
 212 implication $[Fz(0) \geq 0] \Rightarrow [Fz(t) \geq 0 \text{ for all } t \geq 0]$ holds true if and only if
 213 $FM = HF$ for some Metzler matrix H .

214 The characterization for the positivity of the free solution x_{zi} is given in
 215 Rami and Napp [2012] as follows.

216 **Proposition 1** Rami and Napp [2012] The following statements are equiva- {Rami12}
 217 lent.

- 218 i) The non-delayed free system $E\dot{x}(t) = Ax(t)$ is positive.
- 219 ii) There exists a Metzler matrix H such that $\bar{\mathbf{A}} = HP$, where P is defined
 220 via (22).
- 221 iii) There exists a matrix D such that $H := \bar{\mathbf{A}} + D(I - P)$ is Metzler.

{sec3}

{Castelan'93}

222 **Lemma 3** Consider the delay-descriptor system (1) and assume that it is
 223 non-advanced, and the pair (E, A) is regular with index $\text{ind}(E, A) = \nu$. Then,
 224 the free system (2) has a non-negative solution $x_{zi}(t) \geq 0$ for all $t \geq 0$ and for
 225 all consistent initial function $\varphi(t) \geq 0$ if and only if the following conditions
 226 are satisfied.

- 227 i) There exists a Metzler matrix H such that $\bar{\mathbf{A}} = HP$.
 228 ii) $\bar{\mathbf{A}}_d \geq 0$, $(P - I)\hat{A}^D\hat{A}_d \geq 0$.

229 *Proof.* “ \Rightarrow ” For any fixed $t \in (0, \tau)$, since the integral part $\int_0^t e^{\bar{\mathbf{A}}(t-s)} \bar{\mathbf{A}}_d x_0(s) ds$
 230 can be arbitrarily small chosen, independent of the two boundary points 0 and
 231 t , we see that the sum $e^{\bar{\mathbf{A}}t}Px_0(\tau) + (P - I)\hat{A}^D\hat{A}_d x_0(t)$ must be non-negative
 232 for any non-negative vectors $x_0(\tau)$ and $x_0(t)$. The independence of these two
 233 vectors leads to the fact that the sum $e^{\bar{\mathbf{A}}t}Px_0(\tau) + (P - I)\hat{A}^D\hat{A}_d x_0(t)$ is non-
 234 negative if and only if both terms are non-negative. Thus, due to Proposition
 235 1, the non-negativity of the term $e^{\bar{\mathbf{A}}t}Px_0(\tau)$ is equivalent to the claim i). On
 236 the other hand, the non-negativity of the term $(P - I)\hat{A}^D\hat{A}_d x_0(t)$ implies that
 237 $(P - I)\hat{A}^D\hat{A}_d \geq 0$.

238 To prove that $\bar{\mathbf{A}}_d \geq 0$, we assume the contrary, i.e. there exist some indices
 239 i, j with $[\bar{\mathbf{A}}_d]_{ij} < 0$. Thus, for the j th unit vector e_j , we have $[\bar{\mathbf{A}}_d e_j]_i < 0$. For
 240 a sufficiently small $\varepsilon > 0$, let us choose the initial function x_0 as follows

$$x_0(s) = \begin{cases} (1 - \frac{1}{\varepsilon}|t - \varepsilon - s|) e_j & \text{for all } |t - \varepsilon - s| \leq \varepsilon, \\ 0 & \text{otherwise.} \end{cases} \quad (24) \quad \{\text{x0 function}\}$$

The graph of the magnitude of $x_0(s)$ is given in Figure 1. Since $u \equiv 0$,

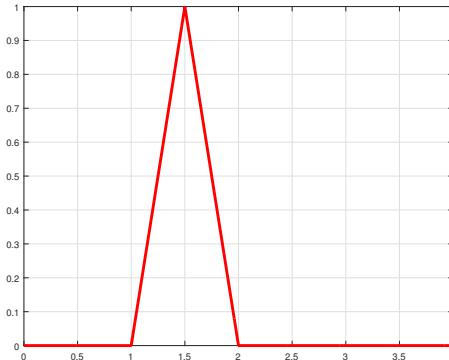

Fig. 1 The function x_0 in (24) with $\tau = 4$, $t = 2$, $\varepsilon = 0.5$.

{fig1}

$x_0(0) = x_0(\tau) = 0$, the consistency condition (16) is trivially satisfied. Then,

we have that

$$\begin{aligned} x_1(t) &= \int_0^t e^{\bar{\mathbf{A}}(t-s)} \bar{\mathbf{A}}_d x_0(s) ds = \int_{t-2\epsilon}^t e^{\bar{\mathbf{A}}(t-s)} \bar{\mathbf{A}}_d x_0(s) ds, \\ &= \int_{t-2\epsilon}^t (I + \bar{\mathbf{A}}(t-s) + \mathcal{O}((t-s)^2)) \left(1 - \frac{1}{\epsilon}|t-\epsilon-s|\right) \bar{\mathbf{A}}_d e_j ds. \end{aligned}$$

Thus, for sufficiently small ϵ , the coordinate $(x_1(t))_i$ have exactly the same sign as $[\bar{\mathbf{A}}_d e_j]_i$, which is strictly negative. This is contradicted to the non-negativity of the solution $x(t)$, and hence, we conclude that $\bar{\mathbf{A}}_d \geq 0$.
“ \Leftarrow ” It is directly followed from i) and ii) that all three summands of $x_{zi}(t)$ are non-negative, \square

Theorem 5 Consider the delay-descriptor system (1) and assume that it is non-advanced, and the pair (E, A) is regular with index $\text{ind}(E, A) = \nu$. Furthermore, assume that $(P - I) \hat{\mathbf{A}}^i \hat{A}^D \hat{B} \geq 0$ for all $i = 0, \dots, \nu - 1$. Then, system (1) is positive if and only if the following conditions hold.

- i) $\mathbf{A} = H P$ for some Metzler matrix H .
- ii) $\bar{\mathbf{A}}_d \geq 0$, $\bar{\mathbf{B}} \geq 0$, $(P - I) \hat{A}^D \hat{A}_d \geq 0$,
- iii) C is non-negative on the subspace

$$\mathcal{X} := \text{im}_+ \left[P, (P - I) \hat{A}^D \hat{A}_d, (P - I) \mathcal{K}_\nu(\bar{\mathbf{A}}, \hat{A}^D \hat{B}) \right]. \quad (25) \quad \{\text{reachable subspace}\}$$

Proof. “ \Rightarrow ” By consecutively choosing $u \equiv 0$ and $\phi \equiv 0$, we see that both the free solution $x_{zi}(t)$ and the zero-state solution x_{zs} are non-negative for all $t \geq 0$. Analogous to the proof of the necessity part in Lemma 3, from the non-negativity of the integral $\int_0^t e^{\bar{\mathbf{A}}(t-s)} \bar{\mathbf{B}} u_j(s) ds$, we obtain $\bar{\mathbf{B}} \geq 0$. Thus, only the claim iii) needs to be proven. We notice that due to Lemma 1 and the property (10) of the Drazin inverse, we have that P and $\bar{\mathbf{A}}$ commute, and $P \hat{E}^D = \hat{E}^D$, and hence,

$$e^{\bar{\mathbf{A}}} \hat{E}^D = \hat{E}^D e^{\bar{\mathbf{A}}} = \hat{E}^D \hat{E} \hat{E}^D e^{\bar{\mathbf{A}}} = P e^{\bar{\mathbf{A}}} \hat{E}^D.$$

Therefore, we see that

$$\begin{aligned} &e^{\bar{\mathbf{A}} t} P x_0(\tau) + \int_0^t e^{\bar{\mathbf{A}}(t-s)} \bar{\mathbf{A}}_d x_0(s) ds + \int_0^t e^{\bar{\mathbf{A}}(t-s)} \bar{\mathbf{B}} u_j(s) ds \subseteq \text{im}_+(P), \\ &(P - I) \hat{A}^D \hat{A}_d x_0(t) + (P - I) \sum_{i=0}^{\nu-1} \bar{\mathbf{A}}^i \hat{A}^D \hat{B} u_j^{(i)}(t) \\ &\subseteq \text{im}_+ \left[(P - I) \hat{A}^D \hat{A}_d, (P - I) \mathcal{K}_\nu(\bar{\mathbf{A}}, \hat{A}^D \hat{B}) \right]. \end{aligned}$$

Thus, the claim iii) is directly followed.
“ \Leftarrow ” It is straightforward that from i) and ii) we obtain the non-negativity of $x(t)$, and due to iii) we obtain the non-negativity of $y(t)$. This completes the proof. \square

{Thm positivity}

If we restrict ourself to the non-delayed case (i.e. $A_d = 0$), the direct corollary of Theorem 5 is straightforward. We, moreover, notice that this corollary has slightly improved the result [Virnik, 2008, Thm. 3.4].

Corollary 4 Consider the descriptor system (3) and assume that the pair (E, A) is regular with index $\text{ind}(E, A) = \nu$. Furthermore, assume that the inequalities $(P - I) \bar{\mathbf{A}}^i \hat{\mathbf{A}}^D \hat{\mathbf{B}} \geq 0$ hold true for $i = 0, \dots, \nu - 1$.

Then, system (3) is positive if and only if the following conditions hold.

i) $\bar{\mathbf{A}} = H P$ for some Metzler matrix H .

ii) $\bar{\mathbf{B}} \geq 0$,

iii) C is non-negative on the subspace \mathcal{X} defined in (25).

{Thm positivity - DAE version}

4 Stability of positive delay-descriptor system

Remark 2 Remark 3.6: We stress out that in previous results on positivity of autonomous descriptor systems (the case when) it is assumed that , which is an unnecessary condition, see for instance [11], [14]. In contrast, our result in Theorem 3.5 provides necessary and sufficient conditions for the positivity of (1) without any a priori assumptions on the projector

In light of Remark 3.6, we illustrate how Theorem 3.5 applies to general situations by presenting an example where ... is not positive and is not Metzler, but the system is nevertheless positive.

Example 3 Let us consider system (1) whose the matrix coefficients are

$$E = \begin{bmatrix} -8.5025 & 0.9037 & -6.1960 \\ -4.8967 & 0.7359 & -3.5750 \\ -0.2285 & 0.1870 & -0.1715 \end{bmatrix}, \quad A = \begin{bmatrix} 0.1628 & 0.7510 & 0.3814 \\ -0.2259 & 1.0891 & 0.1289 \\ -0.1859 & 0.5633 & -0.0226 \end{bmatrix},$$

$$Ad = \begin{bmatrix} -0.6120 & 0.1289 & -0.5673 \\ -0.7736 & 0.1510 & -0.6626 \\ -0.2798 & 0.1117 & -0.2308 \end{bmatrix}.$$

Direct computation yields that the matrix polynomial $\det(sE - A)$ is

$$\det(sE - A) = 0.0688184 s + 0.00897097,$$

and hence the system is not impulse-free, since $\text{rank}(E) = 2$. Nevertheless, Theorem 2 implies that the system is non-advanced. Furthermore, by verifying Theorem 5 we see that the system is both positive and stable.

5 Conclusion

In this paper, we have discussed the positivity of strangeness-free descriptor systems in continuous time. Beside that, the characterization of positive delay-descriptor systems has been treated as well. The theoretical results are

{sec4}

{exam 3}

{conclusion}

291 obtained mainly via an algebraic approach and a projection approach. The
 292 projection approach investigates the positivity of a given descriptor system
 293 by the positivity of an inherent ODE obtained by projecting the given sys-
 294 tem onto a subspace. On the other hand, the algebraic approach derives an
 295 underlying ODE without changing the state, input and output. Then, study-
 296 ing these hidden ODEs is the key point. The main difficulty here is that the
 297 derivative of the input u may occur in the new system. Despite their disad-
 298 vantages, these methods can provide both necessary conditions and sufficient
 299 conditions. Beside these theoretical methods, the behaviour approach, which
 300 leads to some feasible conditions, is also implemented.
